

Technical Meeting Re: WV/ OH PFOA status

Basis of discussion- The December 2015 quarterly report from Chemours sent to Ryan Bahr in Region 5 and Roger Reinhart in Region 3, also the 3/21/08 base maps showing PFOA results in the various Phases of sampling.

Goals following the meeting, or before, if data can be updated on a map to share- a map showing most recent analytical results from various sources and a table with the values, dates and sources of data.

Topics for discussion-

Sampling updates

-Status of any new homes sampled and installation of treatment since December 2015 report. Update of locations on the base map.

Data trends

-The homes that have treatment installed have been resampled periodically for pre and post treatment quality. Are there any data trends for the homes with treatment installed, that would lead us to particular areas that might need further sampling? Particularly updating the 2008 base map with the most recent sampling results.

- UCMR sampling in Ohio and WV- No additional locations found in the vicinity in OH, but the UCMR sampling for Vienna shows an increase from about 0.03- 0.08 in 2008-10, to current UCMR results ranging from .07 to .129. Vienna has resampled and confirmed these results in February 2016 and plans to re-sample again in March 2016. Given that none of the phase sampling efforts were on the Vienna side of the River, what do we know about private wells North and East of Vienna/Parkersburg?

Limits of Detection/ Minimum reporting limit

-The detection limits under UCMR were required at approximately 0.01. The reporting limits for the past couple years for the AO have been in the .001 to .003 range. Are you seeing any issues in getting this level from labs in the pre and post treatment sampling? What is reliable?

-Verification of Sampling Method used now that method 537 is available.

- Confidence in the most recent sampling for homes above the limit of detection. When was this last completed, looking at any trends identified above, should this be repeated?

-Last round of complete sampling under the AO, only continuing at those homes with treatment, any areas needing further investigation looking at the limits of detection.

- Any other sources of information. Are there additional data available for homes in the water districts like Little Hocking, LuBeck, Mason County, etc., besides the December Report, where we know treatment is installed or sampling has been completed?
